No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence encodes the mouse antibody 21.6 heavy chain variable region, Ha, directed against leukocyte adhesion molecule VLA-4. Cloned cDNA sequences of mouse 21.6 VL and VH (AA099889 and AA099892) regions are linked to human constant regions in the construction of a humanized modified using pCR primers (See AA099895-98) and then subcloned into constant regions. In the humanized light chain, maino acids L45, L58 and L69 in the humanized light chain, anino acids L45, by the amino acid present in the equivalent position of the mouse blaced annotating dispersions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for treating inflammatory diseases such as multiple sclerosis can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used fo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mouse cDNAs are modified using PCR primers (AAQ)9895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized heavy chain, amino acids H27, H28, H29, H30, H44 nd H71 in the human HC VR framework are replaced by the amino acid present in the equivalent chimeric antibodies are transfected into COS cells. The humanized entibodies can be used to inhibit adhesion of a leukocyte to an sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can enacting VLA-4, for affinity purification or for generating anti-idiotype antibodies.

cc region (VH) of a humanised alpha-4 integrin antibody 21.6 (see also cc AM22413). It is composed of complementarity determining regions from cc AM22413). It is composed of complementarity determining regions from cc the VH region (see AM22410) of mouse alpha-4 integrin monoclonal cc antibody 21.6 and a modified human 21/28'CL framework. It can be composed in mammalian host cells following PCR amplification and cc mutagenesis of appropriate mouse and human DNA sequences. The cc humanised 21.6 VH and a humanised 21.6 vL (see AAM22412) can be used to produce a claimed humanised 21.6 antibody that is useful in the cc manufacture of a medicament for treating asthma, atherosclerosis, dementia, diabetes, inflammatory bowel disease, rheumatoid cc arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial cc eschaemia, and acute leukocyte mediated lung injury. The humanised cantibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transplant rejection; graft versus host disease; nephritis; atopic dermatitis; psoriasis; myocardial ischaemia; acute leukocyte mediated lung injury; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This polypeptide, designated Ha, comprises the heavy chain variable region (VH) of a humanised alpha-4 integrin antibody 21.6. It is composed of complementarity determining regions (CDRs) from the VH region (see AAW22410) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28/CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human DNA sequences. The humanised 21.6 VH and a humanised 21.6 VL (see AAW22412) can be used to produce a claimed humanised 21.6 antibody that is useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of naturally occurring human antibodies.

CC The sequence represents the mouse anti-VLA-4 antibody 21.6 heavy chain CC wariable region (without signal sequence). Cloned cDNA CDR sequences of comouse 21.6 variable light and variable heavy regions are linked to human CC constant framework regions of the REI antibody for the light chain and CC antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are CC modified using PCR primers (See AAQ9895-99) and then subcloned into CC constant regions. In the humanized light chain, amino acids L45, L49, CC L58 and L69 in the humanized light chain, amino acids L45, L49, CC constant regions. In the humanized light chain, amino acids L45, L49, CC constant regions. In the humanized light chain, amino acids L45, L49, CC clain. Plasmids encoding the chimeric antibodies are transfected into CC cells. The humanized antibodies can be used to inhibit adhesion of a CC leukocyte to an endothelial cell and to treat inflammatory diseases such CC cerebral traumas, meningitis or encephalitis. The antibodies can also be used in the treatment of stroke, CC cerebral traumas, meningitis or encephalitis. The antibodies can also be can did for detecting VLA-4, for affinity purification or for generating CC anti-idiotype antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized heavy chain, amino acids H27, constant regions. In the humanized heavy chain, amino acids H27, constant regions. In the equivalent position of the mouse by the amino acid present in the equivalent position of the mouse Clif g H chain. Plasmids encoding the chimteric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for anti-inflammatory purification or for generating captividators.
                                                                                                                                                                                                                                                                AAW22410

complementarity determining regions (CDRs) of the 21.6 VH can be incorporated into a human 21.78 CL framework to produce a claimed in humanised 21.6 VH can be charmed 21.6 VH (see AAW22413) and a claimed humanised 21.6 VH can be cantibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, carthritis, transplant rejection, graft versus host disease, tumour metastasis, naphritis, atopic dermatitis, provided the season of the constant of the manufacture metastasis, and acute leukcoyte mediated lung injury. The antibody for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibodies of the convenion have a half-life in the human circulation essentially

The present sequence encodes a fusion of the single chain antibody CC hNNR-IU-10 and streptavidin. The antibody binds the antigen ECP40 or CC EPCAM. The fusion protein is expressed using vectors of the invention. CC The specification describes vector constructs for expressing streptavidin CC fusion proteins. The vector comprises a first nucleic acid encoding CC streptavidin or its functional variant operatively linked to a promoter, CC and a cloning site for insertion of a second nucleic acid sequence CC encoding a polypeptide to be fused with streptavidin, interposed between CC the promoter and the first nucleic acid sequence. Alternatively, the CC vector construct comprises a first nucleic acid, operatively linked to a CC promoter, encoding a polypeptide to be fused with streptavidin, and a CC cloning site for insertion of a second nucleic acid, encoding at least CC 129 amino acids of streptavidin or its functional variant. The fusion CC associated with cancer, e.g. adenocarcinomas or hematological CC associated with cancer, e.g. adenocarcinomas or hematological CC mallgnancies. The vector construct is useful for expressing of CC for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian CC host

The present sequence is a fragment of the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was prepd. by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector for the expression of the heavy and light chain DNA mols. was prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain DNA mols. sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent for the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             В

                        AAQ94548 is the plasmid pSCFVT7-hM21, which encodes AAR76682 the human antibody ONS-M21 FV fragment. The plasmid was used in the construction of an expression vector, contg. cDNA encoding a human/murine chimeric antibody, reactive with human medulloblastoma (a brain tumour) cells. The chimeric antibody can be

The present sequence is a scFv fragment from the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was prepd. by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector for the expression of the heavy and light chain DNA mols. was
                                                                                                                                                                                                                         18-OCT-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain DNA mols. sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent for the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g. myeloblastoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR81325 standard; Protein; 119 AA.
The sequence encodes the mouse antibody 21.6 heavy chain variable region, HC, directed against leukocyte adhesion molecule VLA-4. Cloned regions in the constance of mouse 21.6 VL and VH (AAQ99889 and AAQ99892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L58 and L69 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse by the amino acid present in the equivalent position of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Humanized antibody; leukocyte adhesion molecule; VLA-4; therapeutic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21.6 Ig L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and for treating inflammatory diseases such as multiple sclerosis. The meningities or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating

                                                                                                                           B
                                                                                                                                                                                                                                                                    This polypeptide, designated Hc, comprises the heavy chain variable cregion (VH) of a humanised alpha-4 integrin antibody 21.6. It is composed of complementarity determining regions (CDRs) from the VH CZ cregion (see AAW22410) of mouse alpha-4 integrin monoclonal antibody CZ 1.6 and a modified human 21/28°CL framework. It contains an antibody CZ claimed humanised 21.6 VH version Ha (see AAW22412). Humanised CZ 1.6 VH and VL regions are used to produce claimed humanised CZ cantibodies useful in the manufacture of a medicament for treating CZ sthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory CX coversus host disease, tumour metastesis, nephritis, atopic mediated lung injury. The humanised antibodies have a half-life in the human circulation essentially equivalent to that of contribution covering the human set of the human circulation essentially equivalent to that of

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                    405
